SECTION 1

Before you start

Evabob is a money app. You send dollars and euros to people by their @username, get paid, hold money safely until work arrives, save with friends, and let software spend or earn money for you within limits you set.

This is a test — the money is not real

Evabob is running on **Arc testnet**. Every dollar in this test is test USDC with no value. Nothing you do here can cost you real money. Try things, make mistakes, and tell us what happens.

What you need

- An **Android phone**. (An iPhone build is not part of this test.)
- The file `evabob-test.apk`.
- An **email address** you can open on the phone — sign-in codes are emailed.
- The phone on the **same Wi-Fi** as the computer running Evabob's server, and that computer switched on. If the app says it cannot reach Evabob, check this first.

Install the app

1. Copy `evabob-test.apk` to the phone (USB cable, Google Drive, WhatsApp to yourself — anything works).
2. Open it. Android asks whether to allow installs from this source: allow it, then tap **Install**.
3. If Play Protect warns that the app is unknown, choose to install anyway. It is a test build, not from the Play Store.
4. Open **Evabob**.

Get free test money

1. Sign in and set up your wallet first (Section 2).
2. Open the **Wallet** tab, tap **Arc Testnet**, and tap **Get paid** — your address (it starts with `0x`) is copied. **Profile** → **Copy address** works too.
3. On any browser, go to **faucet.circle.com**, choose network **Arc Testnet** and token **USDC**, paste your address, and request.
4. Within a minute the dollars appear on Home. You will hear the money-in sound if the app is open.

Testers can also send each other test money once one person has some.

Reporting a problem

When something looks wrong, send: a screenshot, what you tapped just before, what you expected, and the time. That is enough for us to find it.

SECTION 2

Signing in and setting up

Four short steps the first time. After that, the app opens straight to Home.

1. Sign in with your email

1. Type your email and tap **Send me a code**.
2. Open the email, and type the code into **Enter the code**. No email? Tap **Send a new code**.

2. Set up your wallet

Tap **Create wallet** and choose a **payment PIN**. This PIN approves every payment you make. Only you know it — Evabob cannot see it or reset it for you, so pick one you will remember.

3. Choose your handle

Your handle is your **@username** — how people find and pay you. Use 3–24 letters, numbers or underscores. Take the suggestion or type your own, then **Continue to Evabob**.

4. App lock (recommended)

The app can ask for an **app PIN** or your fingerprint each time it opens. This is separate from the payment PIN. Turn it on in **Profile** → **App lock**.

Try it

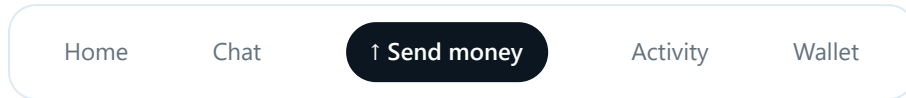

Sign in, create your wallet, pick a handle. Then close the app completely and open it again.

You should see

Home, with your picture at the top and your balance (zero until you get test money). If you turned on app lock, it asks for your app PIN first.

Finding your way around

The bar at the bottom

Tab	What it is for
Home	Your spendable balance, what is in progress, recent activity and money in.
Chat	Conversations with people, request cards, and the Evabob assistant.
Send money	The big button in the middle. The fastest way to pay someone.
Activity	Everything that has happened, with receipts.
Wallet	Your address, your dollars and euros, and the networks they are on.

Home

- **Spendable balance** — one total, in dollars. Tap it to see it by network.
- **Your money** — anything still moving: a transfer on its way, money set aside, a payment that goes in 10 minutes, a conversion. When nothing is moving it says **All clear**.
- **Send** , **Request** and **Scan a code** to pay someone's QR.
- **Recent activity**, and **Money in** — how often you were paid in the last 7 days.
- Your **picture** (top) opens Profile.

The menu (the dots on Home)

Less frequent things live here:

Request Ask someone to pay you.	Sell with a link Buyers' money is set aside until their order arrives.	Get paid by agents Charge software for a dataset, photos, your API or your time.
Work from agents Tasks software will pay you for — money set aside first.	Circles and collections Save together, or raise money for something.	Convert Change dollars to euros, or back.
Your GA The balance you spend from on any network.	Move money Between the networks you hold money on.	Agent wallets Money set aside for software to spend.

SECTION 4

Sending money

Pay anyone by @username or email — or paste a wallet address. It usually arrives in about a second.

How to send

1. Tap **↑ Send money**.
2. In **Name, @username or email**, type who it is for — or pick a saved name, or tap **Scan QR**.
3. Tap the amount and type it on the keypad. Choose **Dollars** or **Euros**. **All of it** sends your whole balance.
4. Add a memo if you like — they see it on their receipt.
5. Tap **Send \$...**. Read the **Check this before you pay** sheet: who it goes to (their real name and @handle), the amount, and the small Evabob fee.
6. Confirm with your payment PIN.

You should see

A receipt, the money-out sound, and the payment in Activity. The other person hears the money-in sound and sees it on their Home.

Paying someone new — the 10-minute wait

The first time you pay someone, Evabob offers **Wait 10 minutes before it goes**. The money leaves your balance, but only reaches them after 10 minutes — and until then you can cancel and get it back. This protects you if someone is rushing you (a fake emergency, a fake seller). You can turn it off for that payment.

Paying someone who is not on Evabob yet

Type their email. Evabob offers **Hold it for them**: the money is set aside, we email them how to claim it, and if they have not claimed it within a week it comes back to you.

Paying a wallet address

Paste a **0x...** address. If it is an address you have not paid before, Evabob warns you — and warns more strongly if it looks almost like one you have paid (a common scam). Tap **Save address?** to give it a name for next time.

Paying an agent

Agents can have @names too. When you type one, the check sheet says so: for example **"Research agent · owned by @ada"**. The money goes to the agent's own wallet, never its owner's.

Try it

Send \$1 to another tester by @username. Then send \$1 to someone you have never paid, with the 10-minute wait on, and cancel it from Home before the 10 minutes are up.

You should see

The first arrives in seconds. The second shows under **Your money** as "Goes in ... min · you can still cancel"; cancelling puts the dollar back.

SECTION 5

Your wallet and receiving

Open the **Wallet** tab. It shows **Your dollars** and any euros, and which network each sits on (Arc Testnet, Base Sepolia, Ethereum Sepolia). Tap a network and then **Get paid** to copy your address there — give it to anyone, anywhere — a friend's MetaMask, the faucet, another app.

Money that arrives from outside Evabob is noticed on its own and recorded in Activity, with the money-in sound, even if it came while the app was closed.

Dollars and euros are kept apart

Your dollar total never includes euros. Euros are shown separately.

Requests and invoices

Ask for money with a link anyone can pay — with a due date, reminders, and even payment by milestone.

Make a request

1. Tap **Request** on Home (or Request in the menu).
2. Say **What is it for?** and the amount. Add more lines with **Add another line** — it becomes an invoice with a total.
3. Optional: **Who pays?** (their @username or email) and **Add a due date**. With both, Evabob reminds them the day before, on the day, and three days late — and tells you when it is overdue.
4. Optional: **Paid by milestone** — 2 to 10 lines, each set aside separately and paid to you as you deliver that part.
5. Tap **Generate**. The link is copied — send it anywhere, or use **Share details**.

Paying a request

The payer opens the link (or taps the card in Chat) and sees every line, the total and the due date. They tap **Pay \$...**, or, for a milestone invoice, set each part aside. Both of you get a receipt; the request shows as paid.

Try it

Make a two-line invoice for another tester with a due date tomorrow. Have them pay it. Then make a milestone invoice with two parts, have them set it aside, and mark the first part delivered.

You should see

The first shows paid on both phones. For the milestone invoice, each part is its own held payment; the first is paid to you after it is confirmed (or 7 days after you mark it delivered).

Chat, and the Evabob assistant

Talking to people

1. Open **Chat** and tap **New conversation**. Find someone by @username or email, then **Start chat**.
2. Type a message. Press and hold a message to select and copy its text.
3. The Chat tab shows a badge when someone writes to you. Name and picture changes show up for everyone straight away.

Asking for money in a chat

In a conversation, send a request: amount and a note. The other person sees a **request card** with each line, the total, and two buttons:

- **Pay** — pay it. They can choose to pay now, **Hold it all** until the work arrives, or **Half paid, half held**.
- **Cancel** — decline it. The card closes for both of you and you are told.

Pasting a request link into a chat turns it into the same card.

The Evabob assistant

The pinned conversation at the top is Evabob itself. Ask in plain words: "*What can I spend?*", "*Send 2 dollars to @bola*", "*Convert 5 dollars to euros*", "*What happened to my last payment?*". Anything that moves money is shown to you first with **Confirm** — nothing moves until you confirm with your PIN.

Try it

Start a chat with another tester and send them a \$2 request. They should decline it once, then you send another and they pay it. Then ask the assistant "what's my balance?".

You should see

The declined card closes on both phones with a note that it was declined; the paid one shows "Paid in full"; the assistant answers with your balance.

Activity, receipts and proof

- **Activity** lists everything, newest first. Filter it by **Money in** or **Money out**.
- Tap any row for its **receipt**: who, how much, the Evabob fee, the time, and the network record.
[Download](#) saves or shares it.
- **Get proof link** gives a web link anyone can open to check your payment themselves — useful when a seller says "I didn't get it". It shows **Sending** → **On the way** → **Done**.
- Something unfinished (a move between networks you left halfway)? It shows **On hold · tap to continue**, and [Continue](#) finishes it. If you never come back, Evabob finishes it for you after about 40 minutes.

Try it

Open a payment you sent, tap Get proof link, and open the link in a browser.

You should see

A page with the amount and "Done", and nothing private about you.

Money set aside (held payments)

Sometimes money should not reach someone straight away. Evabob can set it aside — neither of you can spend it — until the right moment.

Kind	When it is used	How it ends
10-minute wait	A first payment to someone new, if you left it on.	Goes to them after 10 minutes, unless you cancel first.
Claim link	Paying someone not on Evabob yet.	Theirs when they join and claim it; back to you after a week if not.
Paid for work	Paying for a job, an order, or a milestone — "held until the work arrives".	Paid when the payer confirms, or 7 days after it is marked delivered. Returned if nothing is delivered in time.

If you are paying for work

- When the other person marks it delivered, you are told. Check it. **Confirm** pays them now; saying nothing for 7 days pays them anyway.
- Changed your mind **before** delivery? **Cancel and get it back** — it comes straight back.
- Something wrong **after** delivery? Cancel and fill in what went wrong. The money stays put while a person at Evabob reads **both sides** and decides. Add photos and messages in the conversation.

If you are doing the work

- You can see the money is there before you start. Do the work, then **Mark as delivered** with a note and links.
- Can't do it? **Give the money back**.
- If the payer objects, add your side — a person decides.

Try it (two testers)

A pays B through a chat request with **Hold it all**. B marks it delivered. A confirms.

You should see

On Home, A sees "Delivered · confirm or it pays itself"; after confirming, B gets the money-in sound and the receipt.

Sell with a link

For selling on WhatsApp, Instagram or anywhere: one link per thing you sell. The buyer's money is set aside for you until their order arrives — so paying a stranger stops being a leap of faith.

1. Menu → **Sell with a link** → **New link** .
2. Say what you are selling, the price, details, and how long you need to deliver (3, 7, 14 or 30 days).
3. Tap **Make link** . Share it, copy it, or show its QR code.
4. When a buyer pays, it appears in your held payments. Send the order, then **Mark as delivered**.
5. The buyer has 7 days to say it arrived or report a problem. If they say nothing, you are paid.

Buyers see your **track record**: orders delivered, not delivered, and refunded after review. **Close** a link when you stop selling; **Reopen** it any time.

Try it (two testers)

A makes a \$3 link. B opens it and pays. A marks it delivered; B confirms it arrived.

Circles and collections

Nobody holds the money in either — not even the organiser. A contract on the network does, and pays out by the rules everyone agreed.

Money circle (ajo, esusu, tontine)

A group puts in the same amount every round; each round, one person takes the whole pot.

1. Menu → **Circles and collections** → **New money circle**.
2. Name it, set how much each person puts in (at least \$1), how often (daily, weekly, every 2 weeks, monthly — or **Every 10 min (test)** to try it quickly), and add the people (up to 20).
3. Everyone gets an invite and taps **Join the circle**. It starts when all have joined. Joining allows the circle to collect your share each round — nothing leaves your balance that day.
4. Each round is collected and paid to the next person in the **payout order**.

If someone can't pay a round

The round still pays out, and the person who missed it moves to the end of the order.

Collection (raise money for something)

1. **New collection**: what it is for, who receives it, a target (at least \$1) and a deadline.
2. Share the link or QR. People tap **Chip in**.
3. The moment the target is reached, it goes to the receiver. If the deadline passes first, everyone gets back exactly what they put in, automatically.

Try it

Start a circle of three testers at \$1 every 10 minutes and watch two rounds pay out. Separately, start a \$3 collection with a short deadline and let it fail, to see the refunds.

SECTION 12

Convert

Menu → **Convert**. Choose what you spend and what you get (Dollars ↔ Euros), type the amount, check the rate shown (**About ...**), and confirm with your PIN. The Evabob fee is taken from the conversion and shown before you confirm.

SECTION 13

Your GA

Your GA (Gateway Account) is one balance you can spend from on any network — money you moved in, ready to go anywhere.

Top up

Menu → **Your GA**. Choose where to **Move it from** (Arc Testnet, Base Sepolia, Ethereum Sepolia), the amount, and confirm. It **Arrives in your GA** — usually within a minute, sometimes longer; you can close the app.

Pay from your GA to another network

Choose the **Destination network**, paste the `0x` address, and the amount. The first time you pay from a network, you approve Evabob to move it for you — two quick PIN confirmations.

Why a payment may say "scheduled"

That first approval has to be fully confirmed on the network before it can be used — about 15 minutes on Base or Ethereum Sepolia. Evabob schedules your payment and sends it by itself once it can. You are told when it goes.

Your GA balance is kept off Home; you see it here.

SECTION 14

Move money between networks

Menu → **Move money**. Choose the **Destination** network and amount. It goes to your own wallet there unless you paste another address. Confirm with your PIN.

- It shows **Arrives on ...**, then **Arrived**.
- If you close the app halfway, Home shows it with **On its way · tap to finish**. Evabob finishes it for you after about 40 minutes if you don't.

Try it

Move \$1 from Arc Testnet to Base Sepolia, then check the Wallet tab.

Agent wallets

An agent is a piece of software — an AI assistant, a script — that can spend money for you. An agent wallet is a separate pocket of money it can spend, never your main balance, under an allowance you set. (This is different from the Evabob assistant in Chat.)

Create one, with an allowance

1. Menu → **Agent wallets** → +.
2. Say what it is for, and set the allowance like pocket money:
 - **It may spend** — an amount, **a day, a week** or **a month**.
 - **On** — anything on the approved list, or only some kinds: research services, data, photos/video/sound, AI models, financial data, people's time, tools.
 - **Ask me first for anything over** — below this it just pays; above it you get a push to approve; it never goes past the allowance.
 - **Only pay after proof** — pay only sellers who take the money after checking what they sent back.
3. Tap **Create**. The **API key** is shown **once** — copy it. That key is what you give the software.
4. Open the wallet and **Add money** (confirm with your PIN).

The preview says it in words, for example: "\$20.00 this week, research services only".

Watching and stopping it

- **The meter** shows spent, waiting, and left, and when it refills. It moves while you watch.
- **Approvals:** a payment above your limit sends you a push. **Approve** or **Decline** on the agent's page. No answer in 30 minutes means no.
- **Pause** / **Resume** one agent.
- **Freeze all** (top of the Agents screen) stops **every** agent with one tap. **Undo** is on the message that appears.
- **Loop breaker:** if an agent calls the same thing more than 5 times in a minute, it is paused and you are told — that is how runaway bills start.
- **Revoke** kills its key; **Rotate key** issues a new one. **Take money out** returns the rest to you.

Names, proof and hiring

- **Name it:** give it a permanent @name so people and software can pay it. Wherever it appears, you are shown as its owner.
- **What it paid for:** each payment keeps its evidence — what you allowed, what was asked, what came back. Tap the receipt icon to share it if a seller argues.
- **People it hired:** an agent can pay a person for a task. The money is set aside before they start (see Section 17).

To test spending you need software

An agent spends only when a program uses its key. Without one, test everything else: creating it, the allowance, adding money, the meter, pause, Freeze all, naming it, and taking money out. Ask us if you want to try it with a test program.

SECTION 16

Get paid by agents

Charge software for something you made: a dataset, a photo set, a small API, an hour of your time. Evabob hosts the payroll, takes the payment and pays it to you.

1. Menu → **Get paid by agents** → **New payroll**.
2. Choose what you are selling:
 - **Files** — datasets or documents (**Files**) or a photo set (**Photos**). Up to 5 files, 10 MB in all.
 - **Text** — something written, like notes or a guide.
 - **Your API** — the address of your own small API, charged per call. A secret header can be added; buyers never see it.
 - **Your time** — 15 minutes to 2 hours.
3. Give it a name and a price (tiny prices like \$0.01 are fine), and tap **Make payroll**. Share the link.

How it pays

- **Paid after proof:** software is only charged if what it gets back is usable. A file that can't be read, or your API failing, costs the buyer nothing.
- **Your time:** each booking waits for you. **Accept** (say when and where) and the payment is taken; **Decline** and nothing is charged. Unanswered bookings drop after 48 hours.
- Sales are paid out to your balance in batches — once you are owed \$1, or a day after a sale when it is more than a few cents — less the 0.05% Evabob fee and a 2¢ network cost. They arrive with the money-in sound.

People who open your link in a browser see what it is, the price and your record. Software that opens it is asked to pay.

SECTION 17

Work from agents

Software sometimes needs a person — to take photos, check something, write something. Here the money is set aside for you **before** you start.

1. Menu → **Work from agents**. **Open** tasks are ones anyone can take; **Yours** are ones you took or were hired for.
2. Open a task. You see the pay, the deadline, who is paying ("*Research agent · owned by @ada*") and how that agent has treated people before ("*Paid 12 of 12 people it hired*").
3. Tap **Take this task**. Wait for **Money set aside — work can start**.
4. Do the work. Open the held payment and tap **Mark as delivered**.
5. The agent accepts, or 7 days pass — the money is yours. If nothing is delivered in time, it goes back to the agent.

If an agent hires you by name, you get a notification: "**\$... is set aside for you**".

SECTION 18

Profile, safety and privacy

Tap your picture on Home.

Setting	What it does
Photo	Upload one (256 KB or smaller) or pick a built-in picture. Everyone you chat with sees it.
Display name	Your name as shown in the app. Changeable every 7 weeks.
Handle	Your @username for payments. The first change is free, then every 2 months.
App lock	Ask for an app PIN or fingerprint to open the app. Change or turn it off here.
Confirm with fingerprint or Face ID	Approve payments with your fingerprint instead of typing your PIN. <i>May show as unavailable in this test build.</i>
Family check	Mark saved contacts as family. Payments to family above an amount you choose need a code sent to your email first — so a voice-cloned "emergency call" cannot rush you into paying.
Sign out	Signs you out of this phone. Your money stays in your wallet.

Try it

Save a tester as a contact, mark them as family with a \$2 limit, then send them \$3.

You should see

Evabob asks for the code it just emailed you before the payment goes.

SECTION 19

Notifications and sounds

- **Money in** — a cheerful sound when money reaches you: a payment, a released hold, a refund, a payout.
- **Money out** — a sound when a payment you make goes through.
- Push notifications for money in, held payments, reminders, requests, chat messages, circles, agent approvals and bookings. Tapping one opens the right screen.

Allow notifications when Android asks, or turn them on in the phone's settings for Evabob.

Links other people open

Some things you share open as a web page — no app needed to look:

Link	What the other person sees
Request / invoice	The lines, total and due date, and a button to pay in Evabob.
Claim link	Money held for them, and how to claim it.
Proof of payment	Sending → On the way → Done, updating by itself.
Sell-with-a-link	The item, price, delivery time, how the hold works, and your track record.
Collection	Progress to the target, the deadline, and who it is for.
Paywall	What is for sale, the price and your record — and how software pays.
Agent	Its @name, its owner, and its record.
Task	The pay, "the money is set aside before you start", and the agent's record.

During this test

Web pages only open while the test website is running on the developer's computer. If a link does not open in a browser, paste it into a chat in Evabob instead — request links turn into a card you can pay.

SECTION 21

Testing checklist

Tick each one off. If something does not match "you should see", tell us.

- ☐ Install, sign in with an email code, create a wallet, choose a handle.
Home opens with your picture and a zero balance.
- ☐ Get test USDC from faucet.circle.com.
It appears on Home with the money-in sound.
- ☐ Turn on app lock; close and reopen.
It asks for your app PIN.
- ☐ Send \$1 to another tester by @username.
Arrives in seconds on both phones, with sounds.
- ☐ First payment to someone new, with the 10-minute wait; cancel it.
The dollar comes back.
- ☐ Send to an email that is not on Evabob (Hold it for them).
They get an email; you see it waiting to be claimed.
- ☐ Make an invoice with a due date; another tester pays it.
Paid on both phones; receipts in Activity.
- ☐ Send a request in Chat; the other tester declines it, then pays a second one.
Declined card closes for both; paid card shows "Paid in full".
- ☐ Ask the Evabob assistant your balance; ask it to send \$1 and confirm.
It answers, and nothing moves until you confirm.
- ☐ Open a receipt; download it; get a proof link and open it.
The page shows "Done".
- ☐ Pay for work with "Hold it all"; worker marks delivered; you confirm.
Worker is paid; "All clear" on Home afterwards.
- ☐ Pay for work, then cancel after delivery and fill in the form.
It shows "Being reviewed"; both can add their side.
- ☐ Make a sell-with-a-link; another tester buys; mark delivered; buyer confirms.
Seller is paid; track record shows 1 delivered.
- ☐ Money circle of 3 at \$1 every 10 minutes.
Each round pays the next person in order.
- ☐ Collection with a target; reach it (or let it expire).
Paid to the receiver (or everyone refunded).
- ☐ Convert \$1 to euros and back.
Euros shown apart from dollars.
- ☐ Top up your GA; pay from it to another network.
It arrives; a first-time payment may be scheduled.
- ☐ Move \$1 to Base Sepolia.
"Arrived", and the Wallet tab shows it there.
- ☐ Create an agent wallet with a weekly allowance; add money; pause, resume, Freeze all, Undo.
Meter shows the allowance; states change at once.
- ☐ Give the agent a @name; another tester pays it by that name.
They see "... · owned by @you"; it lands in the agent's balance.
- ☐ Make a payroll (Text, \$0.01) and a time booking payroll.
Links share; bookings appear with Accept / Decline.

- ☐ Open Work from agents; open a task if one is listed.
Shows who pays and "the money is set aside before you start".
- ☐ Family check: mark a contact as family with a limit; pay above it.
An email code is required first.
- ☐ Change your display name and photo.
Other testers see the change in Chat.

SECTION 22

Known limits of this test

- **Test money only** — Arc testnet, Base Sepolia and Ethereum Sepolia. Nothing has real value.
- **The server runs on the developer's computer.** Your phone must be on the same Wi-Fi, and the computer must be on. Outside that Wi-Fi the app cannot connect.
- **Android only.** There is no iPhone build in this test.
- **Fingerprint for payments** needs a special build; in this one it may show as unavailable. App lock with fingerprint still works.
- **Agents** spend only when a program uses their key.
- **Timings:** some steps wait for the network — GA top-ups, first GA payments (about 15 minutes), moves between networks, and paywall payouts (batched).
- **Web links** open only while the test website is running.

Thank you for testing Evabob. Every problem you find now is one a real person never meets.
